PITCH STEP 01 / 04

THE SOLUTION

A USDC Bond behind every passport Field.

- Independent AI passes read each Supplier PDF; unclear means Not stated, never a guess.
- Each Operator locks a 10 USDC Bond on Stellar before it delivers.
- A Field proven wrong from the Document Slashes 1/10 of the Bond to the Brand.

👉 **Think:** The guarantee is money on a public ledger, not a promise.

PITCH STEP 02 / 04

PMF

From Feb 2027 every EU battery needs a passport.

- The data sits in Supplier PDFs, each laid out differently, and people retype it by hand.
- AI extraction is fast, but when it's wrong the Brand pays and hears it from an auditor.

👉 **Think:** Brands are liable for passport data they can't verify.

PITCH STEP 03 / 04

TECHNICAL WORKFLOW

Upload → Sieves → Bond on Stellar → Challenge → settle.

- AI Workers (Claude Code, OpenCode, Pi) take Sieves over MCP; Documents live on ICP.
- Trustless Work escrow holds Bond, Fee and output hash; a neutral Arbiter decides Challenges.

👉 **Think:** It's live at doc2dpp.wisecraft.dev, moving real testnet USDC.

PITCH STEP 04 / 04

THE TEAM

Two builders who already work on EU product passports.

- Artur Shirokov: architecture, Stellar escrow and ledger, the Sieve pipeline and agents.
- Viktoria: product and ICP storage, official Templates, Brand reality, the demo story.
- Built on Origyn's DPP platform work: real Templates, real Brand problems.

👉 **Think:** We build passports for a living; this is the part we see break.
